INCIDENT COMMAND FOR THE MOMENTS THAT MATTER

Bring people and facts together when operations are disrupted.

Criticl gives response teams one working record for incident state, ownership, chronology, follow-ups, response guidance, handovers and review.

What Criticl brings into one response record

Declare and establish command	Record the event, known impact, severity and current state, then make command and response roles visible.
Preserve the chronology	Append material observations and evidence references without silently rewriting the incident history.
Coordinate next actions	Track follow-ups, owners and response guidance beside the facts the team is using.
Carry context across shifts	Create a frozen handover snapshot of incident state, roles, open work and recent chronology.
Review and improve	Use the preserved record and post-incident workspace to identify lessons and improvement work.

CURRENT BOUNDARY
Public examples use synthetic data. Criticl does not currently claim live threat monitoring, emergency notification, automatic external execution, certification or end-to-end Australian data residency.

Explore before you buy

Use the public product tour, the interactive crisis exercise and the no-account readiness check to understand the response model before discussing your organisation.
